Project Name	Import Data using Transform Maps	Maximum Marks	4 Marks

IDEATION PHASE | EMPATHIZE & DISCOVER

Empathy Map Canvas

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user’s behaviors and attitudes to help the team better understand their users. Creating an effective solution requires understanding the true problem and the person experiencing it.

WHAT DOES THE USER THINK & FEEL?	
• What really counts: Ensuring data integrity, preventing duplicate employee records, and maintaining accurate parent manager references. • Major preoccupations: Staging table errors, script failures during transform map execution, and security compliance. • Worries & aspirations: Anxiety over corrupted reporting and manual cleanup hours; aspiration for fully automated, reliable legacy data ingestion.	
WHAT DOES THE USER HEAR?	WHAT DOES THE USER SEE?
• Management asking why employee records are disconnected from department managers. • HR staff complaints regarding missing legacy training histories. • Technical recommendations on using Coalesce fields and dot-walking scripts.	• Raw legacy CSV spreadsheets with non-standard column headers. • ServiceNow staging table warning logs and unresolved target sys_ids. • Transform Map configuration interfaces and ACL rule lists.
WHAT DOES THE USER SAY & DO?	
• Attitude in public: Advocates rigorous data validation and adherence to security policies. • Behavior towards others: Collaborates with developers and compliance officers to define precise table and field-level access. • Actions taken: Executes dry-run imports in sub-production instances, writes source mapping scripts, and audits role assignments.	
PAIN (FEARS, FRUSTRATIONS, OBSTACLES)	GAIN (WANTS, NEEDS, SUCCESS METRICS)
• Duplicate employee profiles from improper Coalesce settings. • Unresolved manager references and unexpected staging errors. • Risk of sensitive training data exposure due to weak ACLs.	• Flawless automated data ingestion with zero manual post-import fixes. • Reliable dot-walking resolving complex department hierarchies. • Secure, role-restricted access safeguarding confidential scores.
